How to fold a six-point snowflake

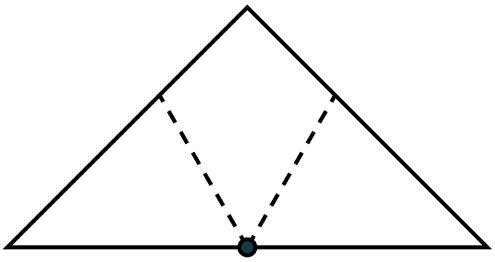

Use thin square paper about 8 in wide. Thick card will not cut cleanly after so many folds.

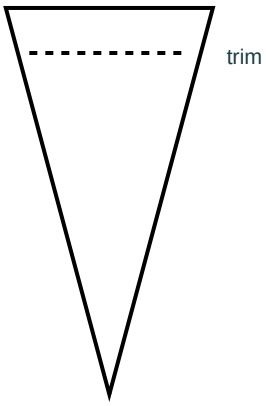

1. Fold the square in half corner to corner to make a triangle. The long edge is now a fold.

2. Pinch a small crease at the middle of the long folded edge. This point becomes the centre.

3. From the centre point, fold the right side forward and the left side back so the straight edge is split into three 60-degree parts.

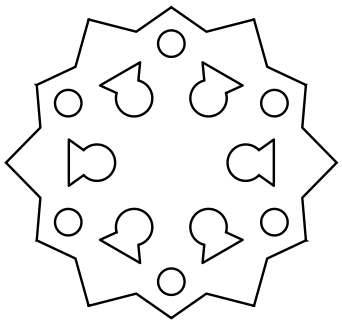

4. Fold the narrow cone in half, trim the top straight, then clip on a template.

Dashed lines are folds. The point of the final wedge is the centre of the snowflake. Templates fit paper 7 in square or larger.

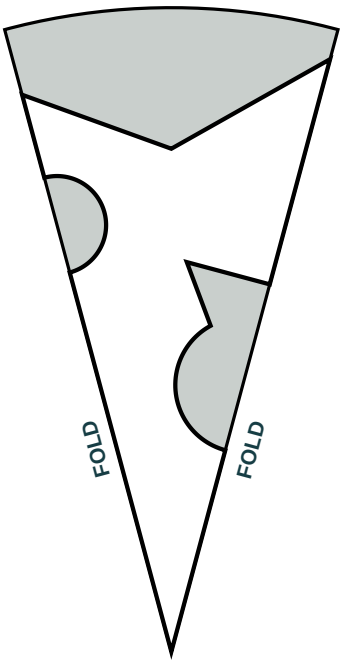

Snowflake templates 1 and 2

Cut the paper template on its outer line, clip it to the folded wedge and cut away every grey shape.
